

CPP ASSIGNMENT-2

1. A C++ program that reverses the digits of a given number and displays the reversed number.
2. A C++ program that generates and displays the Fibonacci series.
3. A C++ program that checks whether a given number is a palindrome or not by comparing it with its reverse.
4. A C++ program that checks whether a given number is an Armstrong number.
5. A C++ program that checks whether the entered alphabet is a vowel or a consonant.
6. A C++ program that checks whether the entered character is an uppercase or lowercase letter.
7. A C++ program that reverses the characters of a given name and displays the reversed string.
8. A C++ program that accepts ten numbers and finds the maximum and minimum values.
9. A C++ program that accepts ten numbers and arranges them in ascending order.
10. A C++ program that creates a function average() to accept an array as an argument and return the average of ten numbers.
11. A C++ program that creates separate string functions to perform operations such as finding the length of a string, converting it into uppercase, lowercase, toggle case, and proper case.
12. A class that stores employee details such as name, age, address, and salary and uses member functions to input and display the information.
13. A class that stores the roll number, name, and age of five students and uses member functions to input and display their information.
14. A class that stores the roll number, name, and age of five students, compares their ages, and displays the youngest and the eldest student.
